Instructions for Reticle Replacement

Remove old reticle and any remaining adhesive from the LED housing.

Using a toothpick, apply a small dot of silicone adhesive to each corner of the reticle mounting surface.

Using tweezers, or similar tool, place the new reticle, shiny side out, on the reticle mounting surface.

Note: After contact with the adhesive, do not move or slide the reticle or the adhesive might spread out and cover the reticle image.

With the back of the tweezers, or other blunt point, gently apply pressure to each corner of the reticle to ensure good adhesion.

Follow the instructions on your particular adhesive for curing time.
