Be amazed.

MOUNTS

Since its introduction in 2014, the Star Adventurer has been at the forefront of the lightweight, portable astroimaging revolution. And now, with the Star Adventurer GTi, we take the next step with full Go-To performance in a compact package.

The all-new Star Adventurer GTi features a built-in illuminated polar scope for precision alignment, USB port, autoguider, V-style dovetail, and SNAP shutter control for your DSLR (programmable via Sky-Watcher's free SynScan Pro app for iOS and Android). Star Adventurer GTi also includes a dual-position counterweight for use at low latitudes as well as full smartphone control via Wi-Fi.

With the added GoTo feature — plus multiple tracking rates including lunar, solar, and sidereal — the heavens are yours to capture and explore. The multifaceted tracking functionality allows imagers to incorporate other techniques into their repertoire, including Milky Way nightscapes alongside traditional deep space and widefield DSLR photography.

With its 11-pound payload capacity, Star Adventurer GTi is well-equipped to handle your DSLR camera sporting a wide-angle or telephoto lens plus accessories, a small aperture astrograph with a dedicated astro camera, or even small OTAs such as our Skymax series of Maksutov-Cassegrain telescopes perfect for deep space objects, the Moon, and planets.

Available in two configurations (with or without tripod and pier extension), Star Adventurer GTi is the perfect mount for the astrophotographer that wants the ultimate in both performance and portability.

FEATURES

- Full GoTo performance in a portable Star Adventurer mount
- Lightweight equatorial mount for deep space, widefield, and nightscape astrophotography
- 11-pound payload capacity
- Multiple pre-programmed tracking rates including sidereal, solar, and lunar
